

LANDFILL GAS EXTRACTION FLARE**ABSTRACT OF THE DISCLOSURE**

5 A landfill methane burner flare has a methane riser within a shroud. The methane riser terminates in a series of spuds that are bent to promote turbulence and mixing in methane passing through and out of the spuds. Louvers can be positioned in the riser to selectively establish a methane gas pressure within the riser, and/or louvers can be positioned between the methane riser and shroud to selectively establish combustion air flow in the flare.
